# Operation Espionage

Kids test for the best way to make invisible ink reveal itself. They discover that mixing a base (invisible ink made from baking soda) and an acid (fruit juice) can create a chemical reaction. In this case, the chemical reaction causes a change in color, making the invisible message appear.

## **Prepare** Ahead

Familiarize yourself with the activity, which happens in three stages:

- I. Writing messages with invisible ink
- **2.** Having a group discussion about acids, bases, and chemical reactions while the messages dry
- **3.** Testing out different ways to reveal the message
- Set up tables for the first stage. Each kid needs a cup with a tsp. of baking soda, a spoon, a couple of cotton swabs, and a piece of paper. Place paper towels and a bowl of water in the center of each table.
- Prepare and set aside materials for the third stage. Each table will need: three bowls filled halfway, one each with grape juice, grape juice concentrate, and cranberry juice; one bowl filled halfway with water plus a few drops of red and blue food coloring (so it looks like juice). Label the bowls with sticky notes. Also set up a bowl filled with cotton balls, and an empty bowl for the used cotton balls.

Lead the Activity

- **Introduce Ruff's challenge.** (5 minutes) Hand out the activity sheets. Tell kids they'll be making invisible ink and writing secret messages with it. Later, they'll make their hidden messages appear!
- Write with invisible ink. (15 minutes) Have kids follow the directions for writing with invisible ink (steps 2 and 3 on the activity sheet). When they've finished, have them leave their papers to dry, which will take about 10 minutes.
- **Discuss acids and bases.** (5 minutes) Tell kids that to make their messages appear, it helps to know a little chemistry. Draw the pH scale (left) on chart paper. Explain that *acids* and *bases* are common chemicals, and give a few examples. (*Citrus juices and vinegar are acids; baking soda, borax, soaps, and other cleaners are bases.*)

The pH scale indicates how acidic or basic a substance is: the scale goes from 0 (most acidic) to 14 (most basic). Acids and bases are chemical opposites, and when they are combined, a chemical reaction can occur. Some signs of a chemical reaction include foaming, fizzing, or a change in color. Tell kids to watch for a chemical reaction as they try to reveal the invisible message.

### Materials

- Activity sheet for each kid
- 1 box of baking soda (1 tsp. per kid)
- Water
- Juices: cranberry and purple grape juices; grape juice concentrate
- Sticky notes to label juices
- Bowls (see "Prepare Ahead")
- Red and blue food coloring
- Measuring spoons
- Plastic spoons (1 per kid)
- Cotton swabs (2 per kid)
- Cotton balls (6 per kid)
- Cups (1 per kid)
- Paper (1 sheet per kid)
- Paper towels (1 roll per table)
- Chart paper and marker

#### National Science Education Standards

#### Grades K-4

Science as Inquiry: abilities necessary to do scientific inquiry; understanding about scientific inquiry

Physical Science: properties of objects and materials

#### Grades 5–8

Science as Inquiry: abilities necessary to do scientific inquiry

Physical Science: properties and changes of properties in matter

Indicates how acidic or basic a subtance is

#### Make predictions. (5 minutes) Ask kids:

- Looking at the pH scale, is baking soda a base or an acid? (A base)
- If you wanted to create a chemical reaction with the baking soda, what would you combine it with, a base or an acid? (*Its opposite, an acid*)
- Of the four liquids you're going to use to reveal your messages (grape juice, grape juice concentrate, cranberry juice, and colored water), which one do you think will work best? Why? (Record predictions on chart paper.)
- What kind of chemical reaction do you think you'll see? Some choices are: foaming, fizzing, or a change in color.
- 5 Set UP materials for revealing the invisible ink. (2 minutes) Prepare tables for the third stage, as outlined in "Prepare Ahead."
- Test the different liquids and make observations. (15 minutes) Have kids follow step 4 on the activity sheet. Make sure they use a different liquid on each section of their paper, as well as fresh cotton balls. Have them pat the liquids sparingly over each section so their paper stays as dry as possible.
  - If time permits, have kids create additional secret messages, trade them with others, and then reveal them.

#### **Discuss what happened.** (10 minutes)

- Ask kids what worked best to reveal the secret message. (*Grape juice concentrate*)
- Is this what they predicted? (Answers will vary.)
- Did any of the other liquids work? (A faint message appeared with the grape juice.)
- What kind of chemical reaction did they see? (A change in color. The grape juice concentrate turned a bluish-green color.)
- Why do you think the grape juice concentrate might have worked better than the other juices? (Answers will vary. Kids may say it has something to do with being a concentrate, which is correct.) Tell kids that grape juice contains a pigment, which gives it its color. The acid-base reaction between the baking soda and grape juice caused a color change, and the amount of pigment in the grape juice influenced how dark the message became. Because grape juice concentrate has more pigment in it than grape juice does, it produces a darker, more visible message.

- 8 Award Points. (5 minutes) Time to rack up some points! Review the activity's key ideas by asking the following questions, worth 50 points each:
  - What does a pH scale show? (How acidic or basic a substance is)
  - Is baking soda a base or an acid? (A base)
  - What about the juice? (An acid)
  - When you mix a base and an acid together, what can happen? (A chemical reaction)
  - What kind of chemical reaction occurred here? (A color change)

# Operation Espionage

Today, your mission is to write with invisible ink and figure out the best way to reveal a secret message.

#### 🚺 get what You need.

1 tsp. of baking soda • Water • 3 bowls, filled halfway with purple grape juice, grape juice concentrate, and cranberry juice, each labeled
1 bowl filled halfway with water and a drop of red and blue food coloring, labeled "colored water" • 1 spoon • Cotton swabs • Cotton balls
Cup • Paper • Pencil • Paper towels

MiX the ingredients. Combine 1 tsp. of baking soda and 1 tsp. of water in a cup and stir. You've just made invisible ink!

### **3** write with invisible ink.

- Fold a sheet of paper into four equal parts. Then unfold.
- Dip a cotton swab into the invisible ink mixture and use it like a pen to write a secret message on each of the four sections. Write something short (like your initials or "RUFF"), since there's not much room.
- Let the paper dry completely, which takes about 10 minutes. You may need to fan it in the air to help it along. What happens to your messages as they dry?

#### A Reveal the secret message!

- While your paper dries, line up the bowls filled with different kinds of liquids.
- On each section of paper, test a different liquid. Starting with one section, dip your cotton ball in one of the juices. Squeeze out the excess juice. Gently pat (don't rub) the cotton over one of the sections of paper.
- Did your message appear?
- Test each liquid on the three remaining sections of your paper. Use a new cotton ball each time. Does one liquid work better than the others to reveal the hidden message? What color is the message?

497

#### chew on This!

When you patted the juice on the dried baking soda, you caused a chemical reaction! Baking soda is what chemists call a base. The juices are acids. When a base and an acid come in contact, a chemical reaction can occur. Some chemical reactions result in a change in color, which is what happened here. The chemical reaction turned the invisible message bluish-green, and that's why you could read it!

# **Cool Science Jobs!**

Like causing chemical reactions? Then you might love one of these jobs.

# **Pyrotechnical chemist**

How about a flashy career that involves playing with fire? A pyrotechnical chemist has the job of creating fireworks. It takes just the right combination of chemicals to make these dazzling bursts of color. Pyrotechnical chemists also create stunning special effects for rock concerts and movies.

## Pharmaceutical chemist

What would it be like to have a job that saves lives and cures diseases? That's what pharmaceutical chemists do—they develop medicines that help people live healthier, happier, longer lives. Vaccines and miracle drugs like penicillin fight deadly diseases and have changed the world for the better. Chemists are the heroes behind these amazing advances.

# Operation Espionage

Secret agents from Washington just gave me the bad news! My missing dog collar has fallen into the clutches of a notorious canine spy named Kennelkov, who's smuggling secret messages inside the collar! A double agent intercepted one of the messages—but it's blank. Could it be written with invisible ink? See if you can figure out how to make the hidden message appear. National security—and the fate of my dog collar depend on it!
